# PIAnEco

# Modelos Lineares Generalizados (GLMs)

## Conceitos Tratados

- estrutura do erro
- preditora linear
- função de ligação
- inverso da função de ligação

# Modelos Lineares Generalizados (GLMs)

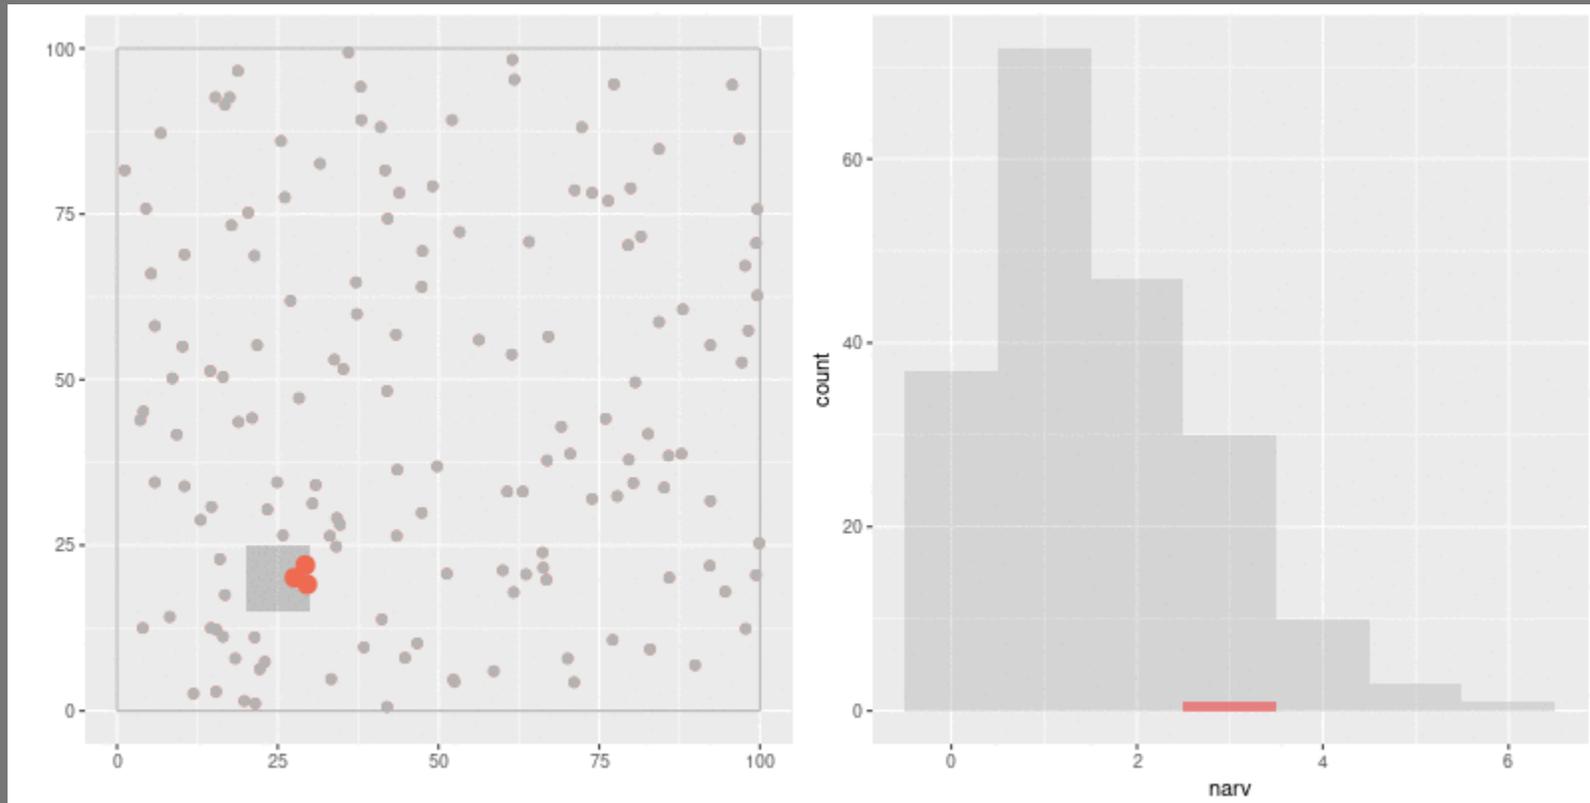

## Outros Conceitos

- Verossimilhança (MLE)
- Quasi-Likelihood
- deviance

# Estrutura do Erro

Contagem de árvores em Parcelas

Completa Aleatoriedade Espacial

# GLMs: conceitos

## Função de ligação

- a função de ligação é aplicada na *Esperança* (valor esperado) da variável resposta aleatória:

$$\eta = g(\mu)$$

## Preditor Linear

- o preditor  $\eta$  é a resposta linear da soma de uma ou mais preditoras

$$\eta = \alpha + \sum_{j=1}^p \beta_j x_{ij}$$

## Função inversa

- a função inversa da ligação retorna à escala da preditora

$$Y = g(\eta)^{-1}$$

# Função de ligação: canônica

- dependendo da estrutura de erro há uma função de ligação padrão

resposta	resíduos	ligação
contínua	gaussiano	identidade
contagem	poisson	log
proporção	binomial	logit
binária	binomial	logit

LMs são GLMs com função de ligação identidade

$$\eta = I(\hat{Y})$$

$$\eta = \hat{Y}$$

# GLMs x Transformar LMs

## Modelo Transformado de LMs

$$f(y)$$

$$f(\hat{Y} + \epsilon)$$

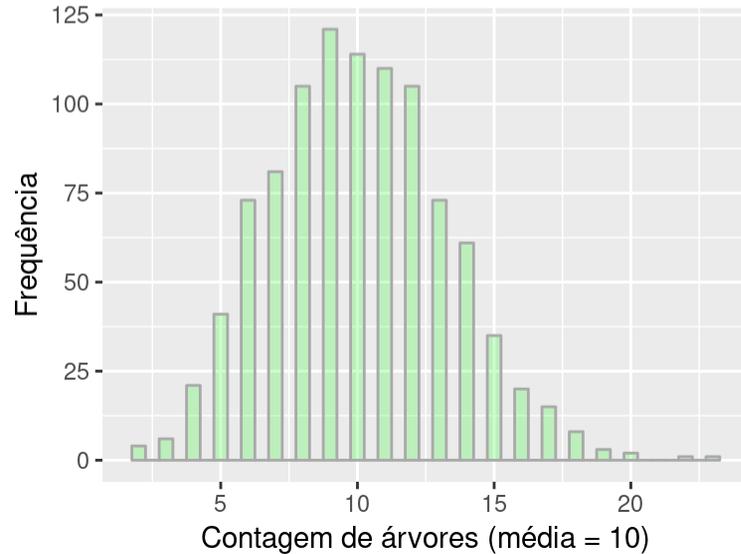

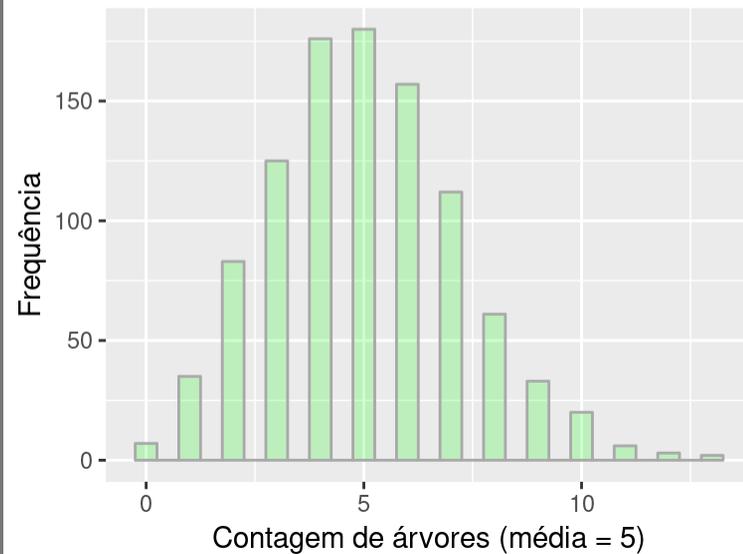

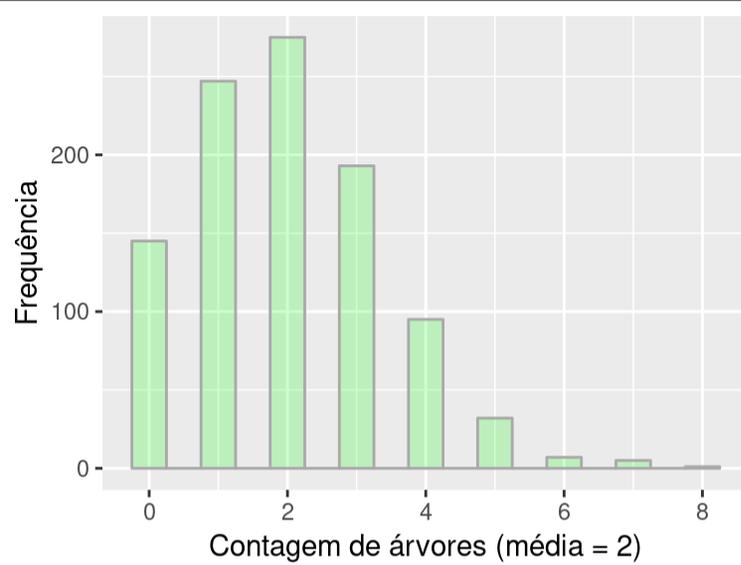

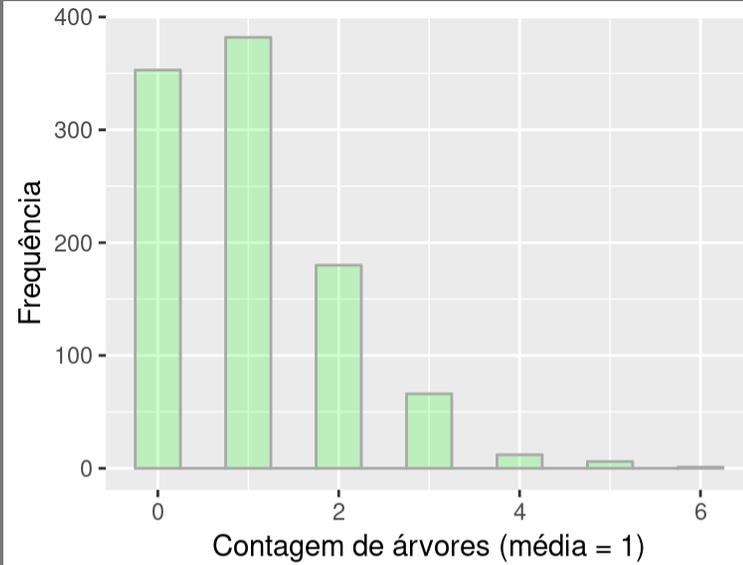

- transforma o valor observado (predito mais o resíduo)

## Função de Ligação

$$f(\hat{Y})$$

- transforma apenas a esperança da variável aleatória
- preserva a estrutura do resíduo
- modela a estrutura do resíduo na escala original (Poisson, Binomial...)

# Estruturas de erro

# Dados de Contagem

- contagem é limitada no zero
- valores discretos (inteiros)
- variância não é constante (aumenta com a média)
- erro não tem distribuição normal
- valores inteiros (não contínuos)

Função de ligação

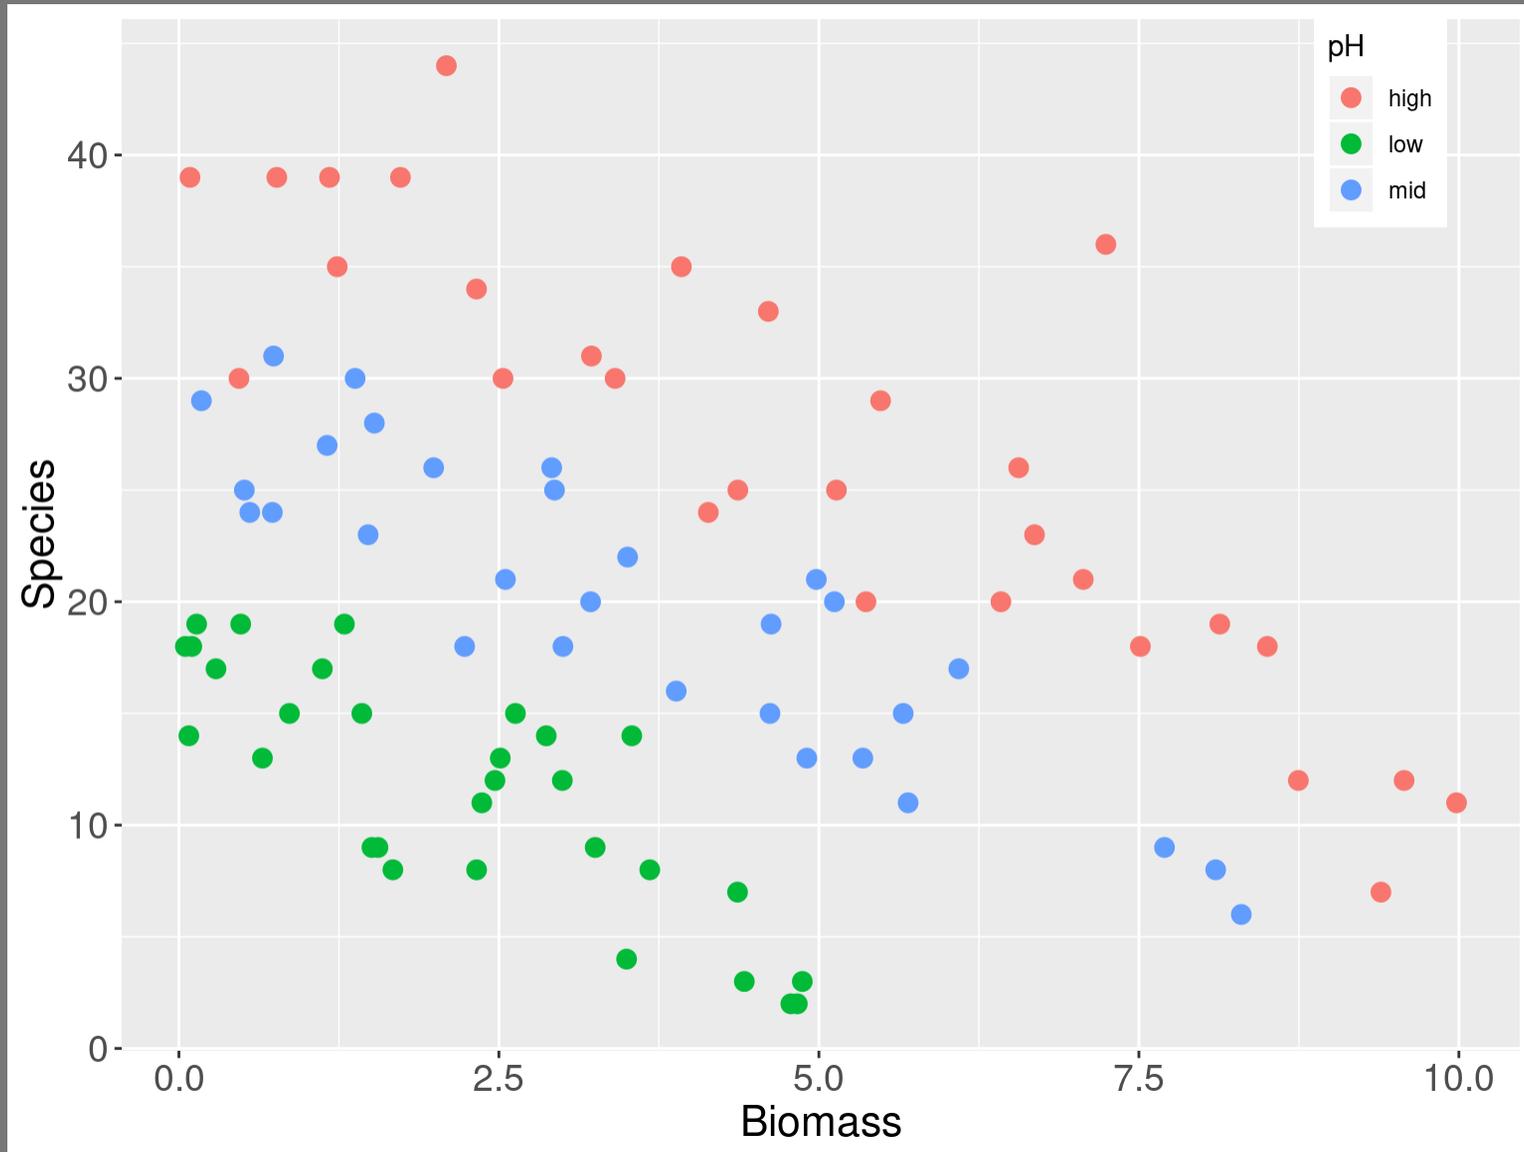

$$\log(\alpha + \sum \beta_i x_i)$$

# Exemplo: Contagem de espécies

- Biomassa e ph do solo estão relacionados à coexistência de espécies

	pH	Biomass	Species
1	high	0.4692972	30
2	high	1.7308704	39
3	high	2.0897785	44
31	mid	0.1757627	29
32	mid	1.3767783	30
33	mid	2.5510426	21
61	low	0.1008479	18
62	low	0.1385961	19
63	low	0.8635151	15

# Gráfico: riqueza de espécies

# Modelo

```
glm01 <- glm(Species ~ Biomass + pH + Biomass:pH, family =  
  poisson, data= arv)  
anova(glm01, test = "Chisq")
```

# Predito pelo modelo: preditor linear

- alto pH, biomassa 0.47 e 7.5
- antilog:  $\exp()$

$\exp(3.717)$

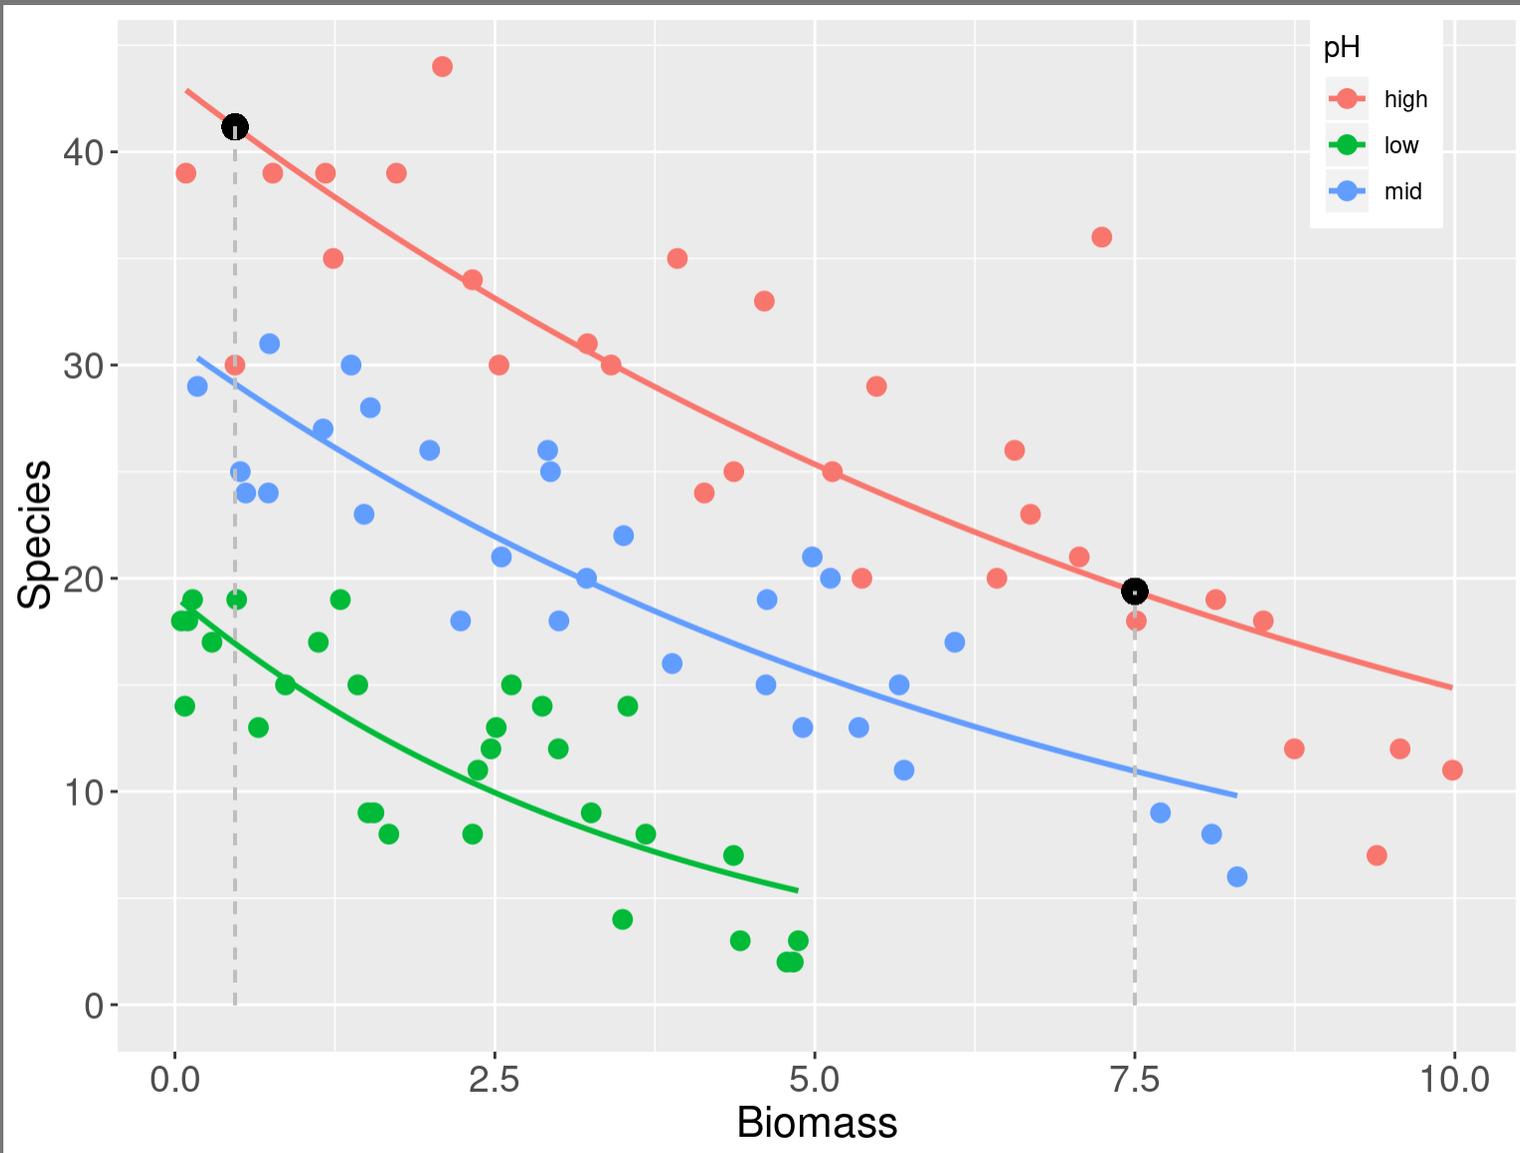

```
## [1] 41.17258
```

$\exp(2.964)$

```
## [1] 19.38792
```

Predito: função inversa

$$\exp(\eta) \text{ ou } \exp(\hat{\alpha} + \hat{\beta} * x)$$

# GLM: modelo de contagem

- faça o modelo cheio usando a família de ligação `poisson(log)`
- avalie o sobre-dispersão do erro pela razão: `Residual deviance/degrees of freedom`
- se o valor da razão for muito maior que 1, ajuste o modelo cheio novamente com a família `quasipoisson`
- se a sobredispersão persistir uma alternativa é modelar o resíduo com a `binomial negativa` (um parâmetro a mais relacionado à agregação)
- compare os modelos simplificados com o mais complexo usando `anova`
  - com `poisson` use o argumento `test = "Chisq"`
  - com `quasipoisson` use o argumento `test = "F"`
- retenha o modelo mínimo adequado
- retorne os coeficientes e preditos do modelo para escala original (antilog)

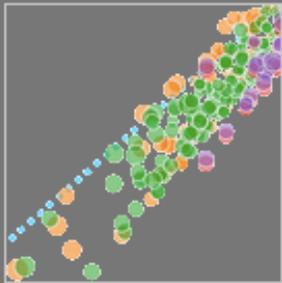

# summary(glm01)

```
 #(Dispersion parameter for poisson family taken to be 1)  
 # Null deviance: 452.346 on 89 degrees of freedom  
 # Residual deviance: 83.201 on 84 degrees of freedom  
 # AIC: 514.39
```

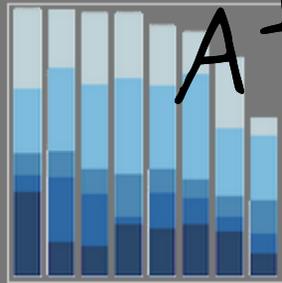

O que fazer quando o parâmetro de dispersão é diferente de 1?

- usar `family=quasipoisson`
- usar modelo com distribuição binomial negativa :  
`glm.nb()` pacote `MASS`

# Gráfico do modelo

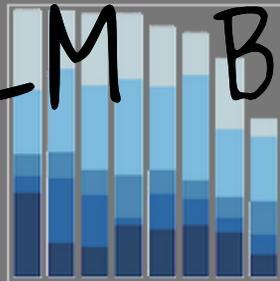

# GLM: ajuste de modelo proporção

- ajuste a variável resposta (sucesso, falha) ou proporção
- não transforme (sucesso, falha) em proporção a menos que o número de tentativas seja igual para todas as unidades amostrais
- use a família de ligação binomial(logit)
- avalie o sobre-dispersão do erro pela razão Residual deviance / degrees of freedom
- razão  $> 1$ , use família quasibinom
- busque o modelo mínimo adequado com anova
  - binomial use test = "Chisq"
  - quasibinom use test = "F"
- retenha o modelo mínimo adequado
- retorne os coeficientes e preditos do modelo para escala original (antilogit)
